Resetting your CCTV WIFI adapter for your new router

- First of all you will need to download an app called 'tether' from the app store.

- Once you have done this you will need a pen! you need to go upstairs to where the cctv equipment is located and find the white plug with blue lights on.

- When you have located this on the bottom of the plug there is a recessed black button labelled 'reset' you will need to press this with the tip of the pen and hold it down for 5 seconds.

- Once you have done this all of the blue lights should come on.

- At this point you need to go on to your smartphone and go in to your settings then wifi and select the network 'tplinkextender'

- When you have connected to the network you will need to open the tether app you installed earlier

- The app will now search and hopefully should find the device, once it has select the device and set the password as 'admin'

- The app will then search for your home network, once it has found it type in the password for your wifi.

- Finally let the app run through its checks and you should be all done!
